FIRE FLOW TESTING

What is fire flow testing?

Fire flow testing measures both the water pressure and volume available in a water system. It is used to determine the quantity and size of fire sprinkler systems required for a property. These tests are typically conducted for both residential single-family homes and commercial/multi-family buildings.

Instructions:

1. Fill out the Water Department application above and pay the fee at City Hall. Be sure to keep a copy of your receipt as proof of payment.
2. The City does not perform fire flow tests for **any properties**, including commercial and multi-family facilities. You will need to hire a certified fire protection company to conduct the fire flow test. The fire protection company must be equipped with the following:
 - Properly working gauges (recently calibrated)
 - Hydrant de-fuser(s)
 - A method for de-chlorination
 - The ability to provide traffic control if necessary
3. After hiring the fire protection company, call the Water Division at (310) 524-2745 to schedule an appointment for the City to inspect and witness the fire flow test.
